

***Ageneiosus uranophthalmus*, a new species of achenipterid catfish (Osteichthyes: Siluriformes) from river channels of the central Amazon basin, Brazil**

Frank Raynner V. Ribeiro and Lúcia H. Rapp Py-Daniel

Ageneiosus uranophthalmus is described from river channels of the central Amazon basin, Brazil. The new species is widely distributed in the Amazon and is distinguished from its congeners by the V-shape snout and eye laterally placed and dorsally oriented, more visible in dorsal view than in ventral view. *Ageneiosus uranophthalmus* shows a range of variation on color pattern when compared with its congeners. This and other differences are described and discussed herein.

Ageneiosus uranophthalmus é descrita de canais de rios da bacia amazônica, Brasil. A nova espécie se distingue das demais congêneres pelo focinho em forma de V e por possuir olhos laterais e dirigidos dorsalmente, mais visíveis em vista dorsal do que em vista ventral. *Ageneiosus uranophthalmus* mostra uma grande variação de padrão de colorido quando comparado com outras espécies do gênero. Esta e outras diferenças são descritas e discutidas.

Key words: Taxonomy, South America, Benthic fishes, Auchenipteridae.

Introduction

Representatives of *Ageneiosus* La Cépède, 1803 are exclusive and widely distributed throughout lowland waters of the Neotropical region ranging from Panama, central America to Argentina, and South America (Walsh, 1990; Ferraris, 2007). *Ageneiosus* had two large revisions. The first was conducted by Eigenmann & Eigenmann (1890). Those authors defined the genus on the basis of morphological characters and recognized six species as valid: *A. atronasus* Eigenmann & Eigenmann, 1888, *A. brevifilis* Valenciennes in Cuvier & Valenciennes, 1840, *A. brevis* Steindachner, 1881, *A. pardalis* Lütken, 1874, *A. ucayalensis* Castelnau, 1855 and *A. valenciennesi* Bleeker, 1864. The second thorough revision was conducted by Walsh (1990). In this work, the genus is represented by ten valid species: *A. brevis*, *A. piperatus* (Eigenmann, 1912), *A. atronasus*, *A. pardalis*, *A. vittatus* Steindachner, 1908, *A. valenciennesi*, *A. ucayalensis*, *A. polystictus* Steindachner, 1915, *A. brevifilis* and *A. marmoratus* Eigenmann, 1912, supposedly sharing two synapomorphic characters: (1) absence of mental barbels in adults, and (2) dorsal margin of the maxillary barbel of nuptial males with enlarged, tooth-like odontodes formed by outgrowths of the maxillae.

According to Ferraris (2003, 2007), *Ageneiosus* encompasses eleven named valid species: *A. atronasus*, *A. brevis*, *A. inermis* (Linnaeus, 1766), *A. magoi* Castillo & Brull, 1989, *A. marmoratus*, *A. militaris* Valenciennes, 1836, *A. pardalis*, *A. piperatus*, *A. polystictus*, *A. ucayalensis*, and *A. vittatus*. Currently, a systematic revision of the genus is under progress by the first author and an undescribed species was recognized from river channels of the central Amazon basin, described herein.

Material and Methods

Counts and measurements were made on the left side of the specimens whenever possible. All measurements are expressed as percents of standard length (SL), except subunits of the head, which are expressed as percents of head length (HL). Straight-line measurements were taken with a digital dial caliper and taken point-to-point, based on Lundberg et al. (1991), Ferraris & Vari (1999), and Ferraris et al. (2005). Measurements included: body depth, taken at the dorsal-fin origin; body width, measured immediately posterior to pectoral-spine insertions; head length, measured parallel to the body axis, from the snout tip to the posterior edge of the bony opercle; head depth, taken at the first nuchal plate base;

head width, taken just posterior to the eye; eyeball diameter, taken as the largest longitudinal measure of the eyeball; snout length, from the snout tip to the anterior margin of the eye; interorbital distance, least distance between medial eye margins; predorsal length, taken from anterior edge of the first dorsal fin spine (spinelet) to the snout tip; prepelvic length, from snout tip to pelvic-fin origin; preanal length, from snout tip to anal-fin origin; pectoral-fin spine length, from origin of spine to its distal tip, not including the fleshy or flexible bony distal portion of the spine; dorsal-fin length, from origin of first branched ray to its distal tip; dorsal-fin spine length, from second spine base at junction with first spine (spinelet) to its distal tip, not including the fleshy or flexible bony distal portion; pelvic-fin length, from base to tip of first unbranched pelvic-fin ray; anal-fin base length, from anal-fin origin to posterior-most base of anal-fin insertion; projection of the snout, distance from anterior edge of mandibular symphysis to snout tip; caudal-peduncle length, from last anal-fin ray insertion to hipurals 2 and 3 joint; caudal-peduncle depth, above tip of last anal-fin ray; mouth width, transverse distance between mouth corners; end of dorsal-fin base to origin of adipose-fin, from insertion of last dorsal-fin ray to adipose-fin origin; second nuchal plate width, measured transversally on its base; second nuchal plate length, from its base to posterior-most tip; and distance between nares, shortest distance between rims.

Fin-ray counts include all rays. The two posterior-most dorsal- and anal-fin rays articulating to the corresponding last pterygiophore of each fin were counted as separate rays. Caudal-fin ray counts include the branched rays and the first unbranched ray of the dorsal and ventral lobes. Gill rakers were counted on the first branchial arch (ceratobranchial and epibranchial).

Osteological preparations were cleared and counterstained for cartilage and bone using the method of Taylor & van Dyke (1985). Branchiostegal rays, procurent caudal-fin rays and vertebral counts were taken from cleared and stained specimens (c&s). In vertebral counts the fused PU1+U1 is considered as a single bone, and the Weberian apparatus as having five elements. Osteological terminology follows Lundberg & Luckenbill (2007).

The examined specimens and comparative material were kindly made available by ANSP, Academy of Natural Sciences, Philadelphia; BMNH, Natural History Museum, London; CAS, California Academy of Sciences, San Francisco; FMNH, Field Musem of Natural History, Chicago; INPA, Instituto Nacional de Pesquisas da Amazônia, Amazonas; MACN, Museo Argentino de Ciencias Naturales, Bernardino Rivadavia, Buenos Aires; MBUCV, Universidad Central de Venezuela, Museo de Biología, Caracas; MCZ, Museum of Comparative Zoology, Cambridge; MHN, Museo de Historia Natural, Montevideo; MNHN, Muséum National d'Histoire Naturelle, Paris; MNRJ, Museu Nacional, Rio de Janeiro; MPEG, Museu Paraense Emílio Goeldi, Belém; MZUSP, Museu de Zoologia, Universidade de São Paulo, São Paulo; NMW, Naturhistorisches Museum, Vienna; RMNH, Rijksmuseum van

Natuurlijke Historie, Leiden; USNM, National Museum of Natural History, Smithsonian Institution, Washington; ZMUC, Kobenhavns Universitet Zoologisk Museum, Copenhagen.

In the list of comparative material examined, the museum abbreviation and catalog number are followed by the total number of specimens in that lot, range of standard length, PH - photograph, ACSI - on-line image in All Catfish Species Inventory Image Base (<http://acsi.acnatsci.org/base/>, Morris et al., 2006) and collecting data.

Results

Ageneiosus uranophthalmus, new species

Fig. 1

Holotype. INPA 8945, 92.1 mm SL, Brazil, Amazonas State, Itacoatiara, rio Amazonas below Paraná da Eva, collected with 3 m bottom trawl in channel 20-30 m deep, approximately 03°13'S 59°01'W, 6 Nov 1992, C. Cox-Fernandes & J. Lundberg.

Paratypes. Brazil, Amazonas: INPA 8257, 1, 150.1 mm SL, Manacapuru, rio Solimões, collected with 3 m bottom trawl in channel 10 m deep, approximately 03°18'S 60°38'W, 18 Oct 1992, C. Cox-Fernandes, J. Lundberg & L. Rapp Py-Daniel. INPA 8287, 1, 71.3 mm SL, rio Purus, mouth of the Purus, collected with 3 m bottom trawl, approximately 03°45'S 61°26'W, 20 Oct 1992, C. Cox-Fernandes, J. Lundberg & L. Rapp Py-Daniel. INPA 8482, 3, 67.8-94.0 mm SL (1 c&s, 94.0 mm SL), collected with the holotype. INPA 8508, 1, 87.4 mm SL, rio Amazonas, near channel of lago Tapará, above mouth of rio Madeira, collected with 3 m bottom trawl, approximately 03°19'S 58°55'W, 4 Nov 1992, C. Cox-Fernandes & J. Lundberg. INPA 17966, 1, 55.6 mm SL, rio Negro, mouth of rio Cueiras, approximately 02°49'S 60°29'W, 01 Oct 1992, L. Chao. INPA 22723, 1, 192.5 mm SL, rio Uatumã at Poço do Arraia, 29 Jan 1985, INPA Ichthyology team. INPA 22796, 1, 206.8 mm SL, Presidente Figueiredo, rio Uatumã, approximately 1 km downstream from Balbina dam, approximately 01°56'S 59°28'W, 1 Mar 1983, INPA Ichthyology team. INPA 22805, 2, 213.0-230.0 mm SL, rio Uatumã, igarapé of Barreto, 27 Apr 1983, INPA Ichthyology team. Diagnosis. *Ageneiosus uranophthalmus* is distinguished from its congeners by the V-shape snout (vs. rounded snout); each upper and lower jaw narrowing anteriorly (Fig. 2); eye laterally

placed and dorsally oriented, more visible in dorsal view than in ventral view (vs. more visible in ventral view than in dorsal view in all other *Ageneiosus* species). It can be further distinguished from *A. atronasus*, *A. magoi*, *A. piperatus*, *A. polystictus*, *A. valenciennesi* and *A. vittatus*, by the larger number of anal-fin rays (41-49, mode 47 vs. 23-39). Differ further from *A. inermis* and *A. marmoratus* by the possession of forked caudal fin (vs. truncate or emarginate). Differ further from *A. brevis* by the uniform coloration, with a brownish to black dorsolateral band (vs. presence of dark dots along flanks); and larger number of anal-fin rays (41-49, mode 47 vs. 29-42). Differ from *A. pardalis* by the uniform coloration, with a brownish to black dorsolateral band (vs. presence of midlateral and sublateral broken dark stripes); longer anal-fin base length (34.6-39.4 vs. 23.0-32.0% SL, according to Walsh, 1990); and larger number of anal-fin rays (41-49, mode 47 vs.

Fig. 1. *Ageneiosus uranophthalmus*, holotype, INPA 8945, 92.1 mm SL, Brazil, Amazonas State, Itacoatiara, rio Amazonas below Paraná da Eva, in lateral (a), dorsal (b), and ventral (c) views.

35-42, according to Walsh, 1990). *Ageneiosus uranophthalmus* is further distinguished from *A. ucayalensis* by the fewer number of gill rakers on first branchial arch (11-16, mode 13 vs. 17-25, mode 22) and dorsal and pectoral spines becoming progressively flexible distally in individuals greater than 100 mm SL (vs. dorsal and pectoral spines strong and distally pointed).

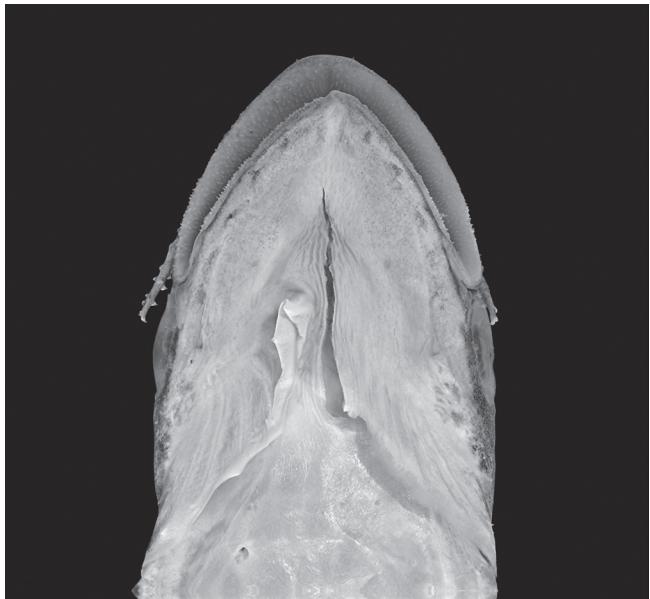

Fig. 2. *Ageneiosus uranophthalmus*, paratype, INPA 22723, 192.5 mm SL. Ventral view of the head.

Description. Morphometric data for holotype and 14 paratypes presented in Table 1. A medium-sized *Ageneiosus*, largest specimen examined 230.0 mm SL. Body relatively elongated, depth at dorsal-fin origin (13.3-17.4% SL) proportionally higher than body width (11.5-14.7% SL). Dorsal profile of body straight to concave from snout tip to dorsal-fin origin; straight to slightly concave from dorsal insertion to adipose-fin origin, gently sloping to beginning of caudal peduncle. Dorsal and ventral profiles of caudal peduncle slightly concave. Ventral profile of head straight to anterior region of isthmus; ventral profile of body slightly convex or straight to anal-fin origin; rising in a straight line along anal fin. Head depressed anteriorly, trunk and caudal peduncle progressively more compressed towards caudal fin. Lateral line complete and midlateral; canal forming irregular zig-zag pattern, with oblique, short, posteriorly directed branches in whole extension. Total vertebrae 51, being 17 precaudal (seven ribbed), and 34 caudal; first pleural rib on sixth vertebra.

Head covered by thin skin. Snout much projected anteriorly, pointed; snout length 51.6-56.9% HL. Eye small (10.2-17.3% HL), laterally placed, dorsally oriented, more visible in dorsal view than in ventral view. Single pair of maxillary barbels, small and filamentous (excepting nuptial males, see Sexual dimorphism, below); maxillary barbels in deep groove at mouth corners. Mouth wide, subterminal, and much projected anteriorly; upper jaw extending beyond lower

jaw by shorter distance than horizontal eye diameter. Posterior-most mouth corners extending beyond vertical through posterior nostril by distance approximately equal to horizontal eye diameter. Upper and lower lips thin; poorly developed.

Jaw teeth minute, slender and conical; teeth arranged in irregular rows, laterally exposed in both upper and lower jaws. Tooth patches anteriorly wide, narrowing posteriorly. Tooth patches of upper jaw almost completely exposed when mouth closed; completely exposed on posterior corner. Number of tooth rows increase with size; specimens greater than 100 mm of SL with 15-20 anterior and 5-8 posterior rows on upper jaw and 11-16 anterior and 9-13 posterior rows on lower jaw; specimens smaller than 100 mm SL with 8-15 anterior and 3-6 posterior rows on upper jaw and 9-11 anterior and 7-11 posterior rows on lower jaw.

Cranial fontanel triangularly elongated in dorsal view, open from mesethmoid to supraoccipital base, terminating behind vertical through posterior margin of eye. Branchiostegal membrane broadly attached to isthmus, supported by 9 branchiostegal rays. Gill opening relatively wide, its posterior margin extending to horizontal through pectoral-spine base. Gill rakers well-ossified, sharp and slender; 11-16 (mode = 13) on first branchial arch; 2-4 on epibranchial (mode = 3), 9-13 on ceratobranchial (mode = 10; n = 15). Anterior internarial width greater than posterior one; posterior nostril closer to anterior nostril than to orbit. Each nostril surrounded by very low fleshy rim, more visible in larger specimens.

Dorsal-fin origin located posterior to vertical through

Table 1. Morphometric data of *Ageneiosus uranophthalmus*. Range includes the holotype (H).

Measurements	H	n	Low	High	Mean
Standard length (mm)	92.1	15	43.7	230.0	118.0
Percents of standard length					
Predorsal length	29.3	15	27.0	33.4	29.7

Internarial length	15.5	15	12.5	17.6	15.2
Anterior internarial width	32.3	15	28.3	35.1	31.5
Posterior internarial width	24.6	15	22.7	27.4	24.6
Eyeball diameter	11.2	15	10.2	17.3	12.2
Mouth width	51.6	15	47.2	55.6	50.6
Second nuchal plate width	14.9	15	13.2	20.1	15.8
Second nuchal plate length	14.8	15	12.1	17.6	15.0

pectoral-fin origin. Dorsal-fin spine slender, straight; strong and pungent in juveniles (smaller than 100 mm SL), becoming progressively flexible distally in adults (greater than 100 mm SL); anterior medial margin with numerous small osseous granulations along proximal half in specimens smaller than 100 mm SL, and along almost entire spine in larger specimens (excepting nuptial males, see Sexual dimorphism, below); posterior margin with medial row of widely spaced and reduced dentitions. Dorsal fin I,5 (n = 15); last branched ray very small. Adipose fin relatively small and largely variable in shape, from triangular to quadrangular shaped; its origin anterior to end of anal-fin base. Caudal fin deeply forked, with pointed lobes. Outermost branched rays twice as long as middle rays. Upper caudal-fin lobe slightly longer than lower lobe, its outer principal rays non-filamentous, 8+9 principal rays, 17 upper procurent, 15 lower procurent rays (n = 15). Anal-fin base longer than predorsal length, 34.6–39.4% in SL. Anal-fin origin located at or slightly posterior to vertical through tip of the innermost pelvic-fin rays. Last unbranched and three anteriormost branched anal-fin rays more developed; rays decreasing slightly in length posteriorly. Anal-fin margin straight to slightly convex. Anal-fin rays iv-v, 37–45 (mode = 43, n = 14); anal-fin distal pterygiophores 43. Pelvic-fin margin rounded; i,6; first branched ray longest. Pelvic-fin origin located at or slightly anterior to vertical through depressed first branched dorsal-fin ray. Pectoral fin with I,12–13 (mode = 13; n = 15); first branched ray more developed, subsequent rays decreasing in size. Pectoral-fin spine changes with age. Spine of juveniles (less than 100 mm SL) strong, distally pointed, continued in filamentous ray; dorsal and ventral surfaces smooth; posterior margin with, uniformly retrorse, unicuspis, 8–13 dentations (n = 9); anterior margin with osseous granulations along proximal half. Spine of adults (more than 100 mm SL) rigid proximally, becoming progressively flexible distally; dorsal and ventral surfaces smooth; anterior and posterior margins with osseous granulations along proximal half.

Color in alcohol. Body ground coloration white to yellowish. Brownish to black dorsolateral band extending from head to upper caudal-fin base and with variable thickness - restricted to dorsal area (in individuals smaller than 120.0 mm SL) to extending ventrally onto lateral line (in individuals greater than 190.0 mm SL). Dorsolateral band commonly broken into longitudinal series of prominent blotches or appearing somewhat mottled. Lateral and ventral surfaces of body light, with scattered dark pigmentation of variable intensity, usually concentrated on dorsal portion of body (two individuals from rio Negro, INPA 17966 and 31252, with lateral surface of body much pigmented; brownish). Dorsal surface of head completely covered with irregular mottled pattern consisting of dark brown blotches or brownish (in individuals larger than 150 mm SL). Smaller specimens (below 130 mm SL) with two dark bands running parallel from middle of snout, along each margin of fontanel, to level of dorsal-fin insertion. These bands crossed by dark area on mesethmoid and on nuchal

plate. Abdomen unpigmented.

Fins with marked ontogenetic variation. Smaller specimens usually with dark bands on pectoral, pelvic completely dark, anal fin with distal dark band; dorsal and caudal fins hyaline. Above 130 mm SL, general fin coloration faint, with faded dark bands on anal fin, pelvic brownish, but dark bands still present on pectoral in most specimens. In these larger specimens, dorsal fin with anteriormost rays darker; caudal fin pigmentation vary from presence of dark basal band, followed by hyaline band and dark-pointed tips of the lobes to complete hyaline.

Barbels with scattered dark chromatophores, appearing white or dark.

Sexual dimorphism. The single mature males has strong morphological modifications already known to occur in representatives of the genus. The nuchal region in nuptial males (from frontal to nuchal plates; Fig. 3) shows a much more acute angle than in females and nonbreeding males. The ossification of the maxillary barbel begins at its base and proceeds towards its tip, resulting in a small, thickened, rigid barbel, reaching beyond anterior eye margin. The dorsal and medial surfaces of the barbel are covered with sharp, unicuspis dentations; the dorsal row with eight dentations along full extension of the barbel and the medial row with four dentations along distal half.

The dorsal fin is modified. The first branched dorsal-fin ray is longer than in nonbreeding males and females. The dorsal-fin spine is straight, more rigid and elongate, its length is about two times the length of the first branched ray; the anterior margin with two rows of numerous, uniformly retrorse, unicuspis dentations, becoming progressively less prominent and pungent and more concentrated proximally; rows of dentations ending proximally on a large osseous tubercle. The dorsal-fin spine of males can be hyperextended anteriorly to approximately a 45° dorso-anterior angle, instead of the near-vertical limit of females and juveniles.

The anterior portion of male anal-fin is highly modified in comparison to that in non-breeding specimens. The unbranched and the three anteriormost branched anal-fin rays are elongate and joined together, modified as a structural support for the intromittent organ. The genital pore is at the intromittent organ tip. In adult females, the unbranched and two or three anterior branched anal-fin rays are much longer than the subsequent rays.

Ecology. Juveniles of *Ageneiosus uranophthalmus* were taken in small bottom trawls in swiftly flowing open channels over sand, clay and detritus substrates. Approximate depth of capture between 5–30 m. The largest specimens were collected with gillnets only in the rio Uatumã.

Distribution. *Ageneiosus uranophthalmus* is known from the middle reaches of the Amazon Basin, Brazil (Fig. 4), mainly rio Amazonas, rio Solimões, rio Negro, rio Purus and middle rio Uatumã.

Fig. 3. *Ageneiosus uranophthalmus*, paratype, INPA 22723, 192.5 mm SL, nuptial male in lateral view.

Etymology. The specific epithet, *uranophthalmus*, is derived from the Greek *ouranos* (sky, heaven) and *ophthalmos* (eye) in allusion to the dorsally oriented eyes.

Remarks. The new species herein described exhibit the osteological and sexually dimorphic features proposed as synapomorphic for the family Auchenipteridae (Ferraris, 1988; Royero, 1999). Within the Auchenipteridae, *Ageneiosus uranophthalmus* shares with its congeners the two characters states proposed by Walsh (1990) as synapomorphic for the genus: absence of mental barbels in adults, and dorsal margin of the maxillary barbel of nuptial males with enlarged, tooth-like odontodes formed by outgrowths of maxillae.

More than 30 specific names were proposed in *Ageneiosus*. More than 20, however, have been considered synonyms of the 11 named valid species actually recognized (Walsh, 1990; Ferraris, 2003, 2007). A comparative analysis with types and original descriptions allowed concluding that the diagnostic

characters of *A. uranophthalmus* are unique within the achenipterids. The intrageneric biodiversity and relationships of *Ageneiosus* are still under investigation.

Comparative material. *Ageneiosus atronasus*: Brazil, Amazonas: INPA 18557, 63.1-115 mm SL, rio Purus, lago Samauma. INPA 13392, 1, 104.0 mm SL, rio Solimões, ilha da Marchantaria. INPA 18988, 8, 81.6-93.0 mm SL, rio Solimões, lago Mamirauá. Rondônia: INPA 10945, 1, 106.8 mm SL, rio Jaci-Paraná. INPA 10955, 2, 94.0-102.0 mm SL, rio Jaci-Paraná. Bolivia: INPA 651, 6, 96.1-116.0 mm SL, laguna Capital, rio Mamori. *Ageneiosus brevis*: Brazil, Amazonas: NMW 47801 (2), Syntypes, rio Amazonas near Coari and Hyavary. INPA 11759, 5, 117.2-165.4 mm SL, rio Amazonas, ilha do Careiro. INPA 13393, 1, 111.1 mm SL, rio Solimões, ilha da Marchantaria. INPA 22139, 7, 113.8-162.0 mm SL, rio Solimões, lago do Rei. INPA 26537, 1, 115.6 mm SL, Manaus, mouth of the rio Negro. Pará: INPA 22722, 2, 115.0-116.0 mm SL, rio Amazonas, Lago Grande de Monte Alegre. Rondônia: INPA 21720, 1, 117.7 mm SL, rio Guaporé, rio Cautário. Pará: INPA 5073, 3, not measured, rio Trombetas, rio Cuminá, lago Salgado. INPA 22629, 1, not measured, rio Tocantins, Poço do Paulo. INPA 22740, 2, 149.2-171.0 mm SL, rio Tocantins, Poço do Paulo. INPA 22818, 2, 179.7-188.6 mm SL, rio Trombetas, Cachoeira Porteira. MZUSP 5720, 7, 88.5-157.6 mm SL, Santarém, rio Tapajós. MZUSP 74700, 1, 128.8 mm SL, rio Amazonas, Ituquara canal, below Gurupá.

MZUSP 74872, 4, 123.0-165.0 mm SL, Barcarena, Taperebá. Tocantins: INPA 20146, 1, 166.2 mm SL, Caseara, rio Araguaia, lago Volta Grande. *Ageneiosus vittatus*: Brazil, Acre: MZUSP 53079, 1, 186.0 mm SL, rio Juruá, Reserva Extrativista do alto rio Juruá. Amazonas: MZUSP 92185, 2, 154.8-184.7 mm SL, rio Negro, rio Tiquié, 69°41'26"W 00°04'41"N. MZUSP 93034, 1, 139.2 mm SL, rio Negro, rio Tiquié, 69°41'00"W 00°04'00"N. MZUSP 93076, 1, 139.2 mm SL, rio Negro, rio Tiquié, 69°35'00"W 00°11'00"N.

Acknowledgements

We thank Osvaldo Oyakawa (MZUSP), José Lima de Figueiredo (MZUSP) and Wolmar Wosiacki (MPEG) for the assistance dedicated to FRVR during his visit to the collections under their care and for the loan of the specimens; Helmut Wellendorf (NMW) for the loan of syntypes and providing photographs; Paulo Buckup (MNRJ) for the loan of types; James MacLaine and Patrick Campbell (BMNH); Karsten Hartel (MCZ); John Lundberg and Mark Sabaj Perez (ANSP); Romain Causse, Zora Gabsi and Claude Ferrara (MNHN); Ronald Ruiter (RMNH); Sandra J. Raredon (USNM); and Tammes Menne (ZMUC) for providing radiographic images and photographs of the types. We are grateful to André Canto (INPA) for the images and Ariana Ribeiro (INPA) for the donation of specimens. This paper was greatly improved by the comments and suggestions of the editorial board and anonymous two referees.
